

Seedless — Demo Voiceover (2:06 cut)

Each beat's timecode matches your edited video. Read the highlighted phrases with weight. Pace ≈ 120 wpm — leave a half-second pause between beats.

1. ONBOARDING 0:00 – 0:12

Hey, I'm Francis, founder of Seedless. A passkey wallet on Solana — no seed phrase, no extension. One face scan, account created, on mainnet.

On screen: portal.lazor.sh → name entry → passkey save prompt → "signing in"

2. HOME + RECEIVE 0:12 – 0:24

Wallet's live, already funded. You can receive any Solana token right from this QR — standard Solana address, share with anyone.

On screen: home \$14.76 → Receive QR → back to home

3. SWAP (JUPITER) 0:24 – 0:44

Now swapping. Zero point one SOL into USDC. Jupiter routes the trade in the background — best price across every DEX on Solana. I review, FaceID, done. Notice the gas — sponsored by our relayer through Kora. The user pays nothing extra.

On screen: Swap → 0.1 SOL → 9.34 USDC quote → simulate → Review → FaceID → "Swap complete"

4. BALANCE + BURNER CREATE 0:44 – 0:56

Swap settles. Now here's the part nobody else ships on mobile. I tap burner, create a fresh wallet. Privacy is built in, zero setup.

On screen: home updates after swap → Burners → Create burner "Test" → Tools menu (Stealth / Burners / Private mode)

5. GASLESS SEND 0:56 – 1:24

This is gasless send. Drop a recipient, zero point zero five SOL, hit send. FaceID approves, the relay sponsor the network fee — no SOL needed for gas, ever.

On screen: Send → paste address → enter SOL → Lazor portal sign-in → Review → FaceID → home updates

6. PRIVATE SEND VIA BURNER (UMBRA) 1:24 – 1:48

From the burner, I tap private send. Powered by Umbra under the hood — recipient gets the funds, but the link to my main wallet stays hidden on chain. Sender and amount, both private.

On screen: burner with funds → "Private send via Umbra" → 0.05 SOL → "Getting ready" → "Sent privately — amount and sender hidden"

7. STEALTH PAYMENT REQUEST (SOLANA PAY) 1:48 – 2:04

And receiving privately works the same way. I generate a payment request, pick USDC, enter the amount. What pops out is a Solana Pay QR — any wallet can scan and pay. Funds land privately, my main address never exposed.

On screen: Stealth → Payment request modal → USDC tab → amount → Generate QR code

8. CLOSE 2:04 – 2:06

That's Seedless. Private mainnet beta, live now.

On screen: home final balance
